

The FDA can help save the lives of those with type 1 diabetes.

Piper, age 8, diagnosed at age 3

Piper has type 1 diabetes. One in twenty people like Piper will die from low blood sugar.

In fact, kids and adults are dying every day from low blood sugar or complications caused by type 1 diabetes.

In the next few weeks, the FDA has a chance to show it is leading the world in medical innovation, not standing in its way. It will lay out the pathway to bring to market the first **artificial pancreas**, a life saving technology now under development, and **the most revolutionary treatment in diabetes since the discovery of insulin.**

Three million kids, teens, and adults with type 1 diabetes are counting on the FDA to get it right. Our lives and health are at stake.
